TRACK RECORD OF INNOVATION-DRIVEN DISRUPTION

Market Need

Response

MDM Has Changed

Trends in MDM

1. Demand for Multi Domain MDM is on the rise
2. Accelerated move to the Cloud
3. Contextual MDM for connecting transactions & interactions
4. Use of AI and ML to simplify MDM
5. Modern Integration patterns for MDM
6. Combine MDM and Governance
7. MDM for ERP transformation
8. All in One capabilities

Demand for Multi domain MDM is on the rise

- Single view across every function
- Master beyond customer and product domains
- MDM that can support current and future domain requirements

| Trend 1

Trend 2

Accelerated move to the cloud

- Cloud first mindset
- Microservices-based and “all-in-one”
- Scale and cost advantages
- Designed for business users

Other considerations...

- Infrequent upgrades
- Monolithic architectures
- “Noisy neighbors” in multitenant architectures
- Limited innovation
- Multi-vendor approach

5 Pitfalls of “Legacy” Cloud Master Data Management

Not all cloud MDM systems are created equal. Although the term “legacy” is most commonly equated to on-premises systems, the same principles can be applied to the cloud. Legacy cloud systems, typically built prior to 2015, are not the same as cloud native systems. But what does the term “cloud native” mean, and why is it so important? The Cloud Native Computing Foundation provides an **official definition**:

“Cloud native technologies empower organizations to build and run scalable applications in modern, dynamic environments such as public, private, and hybrid clouds. Containers, service meshes, microservices, immutable infrastructure, and declarative APIs exemplify this approach.

These techniques enable loosely coupled systems that are resilient, manageable, and observable. Combined with robust automation, they allow engineers to make high-impact changes frequently and predictably with minimal toil.”

Informatica

Contextual MDM for connecting transactions & interactions

- Combine master and non-master data
- Rich Business 360 views
- Blurring lines between MDM and e.g. Customer Data Platform (CDP)

| Trend 3

Trend 4

Use of AI and ML to simplify MDM

- Scale stewardship with intelligence and automation
- Metadata-driven automated match tuning, data model and mapping recommendations
- Next best action for business users

Modern integration patterns for MDM

- New source and target ecosystems
- Transaction/Interaction data drives new latency requirements
- Master data curation and orchestration

| Trend 5

| Trend 6

Combine MDM and Governance

- Ability to document data definitions, processes, policies, rules and metrics
- Seamless integration to enforce execution of rules and policies in MDM and ability to track metrics
- In high demand for Reference Data Management

MDM for ERP transformation

- Rationalize and improve master data quality for ERP transformation
- Manage and synchronize data between ERP systems

Trend 7

ERP

A hand is pointing at a digital interface. The interface features a large central hexagon with the text 'ERP' in bright blue. Surrounding this central hexagon are several smaller hexagons, each containing a different business-related icon: a shopping cart with a downward arrow, a group of people, a factory, a gear, a dollar sign with a circular arrow, and a robotic arm. The background is dark blue with a grid of small white dots. A thick orange diagonal line runs from the bottom left towards the top right, separating the text area from the graphic area.

Using Master Data Management to Ensure Successful ERP Migrations

- Manage and synchronize data between ERP systems
- Rationalize and improve master data quality
- Use master data to make business processes more resilient
- Centralize and streamline internal and external data onboarding

https://www.informatica.com/about-us/webinars/reg/using-master-data-management-to-ensure-successful-erp-migrations_2404575.html

Summary

Reduce Risk & Make Business Processes More Resilient

ERP migrations typically require two or more ERP systems to function simultaneously for a significant amount of time—meaning that data quality and data synchronization are key to project success.

“Using Master Data Management to Ensure Successful ERP Migrations” shows you how to move your ERP migration project forward with Informatica MDM. You will learn how to:

- Manage and synchronize data between ERP systems
- Rationalize and improve master data quality
- Use master data to make business processes more resilient
- Centralize and streamline internal and external data onboarding

Who We Are

Founded in 1926 by two brothers, Conrad and Marcel Schlumberger from Alsace, France, Schlumberger is best known for the invention of wireline logging - a groundbreaking technique used to measure the presence of hydrocarbons in oil and gas wells.

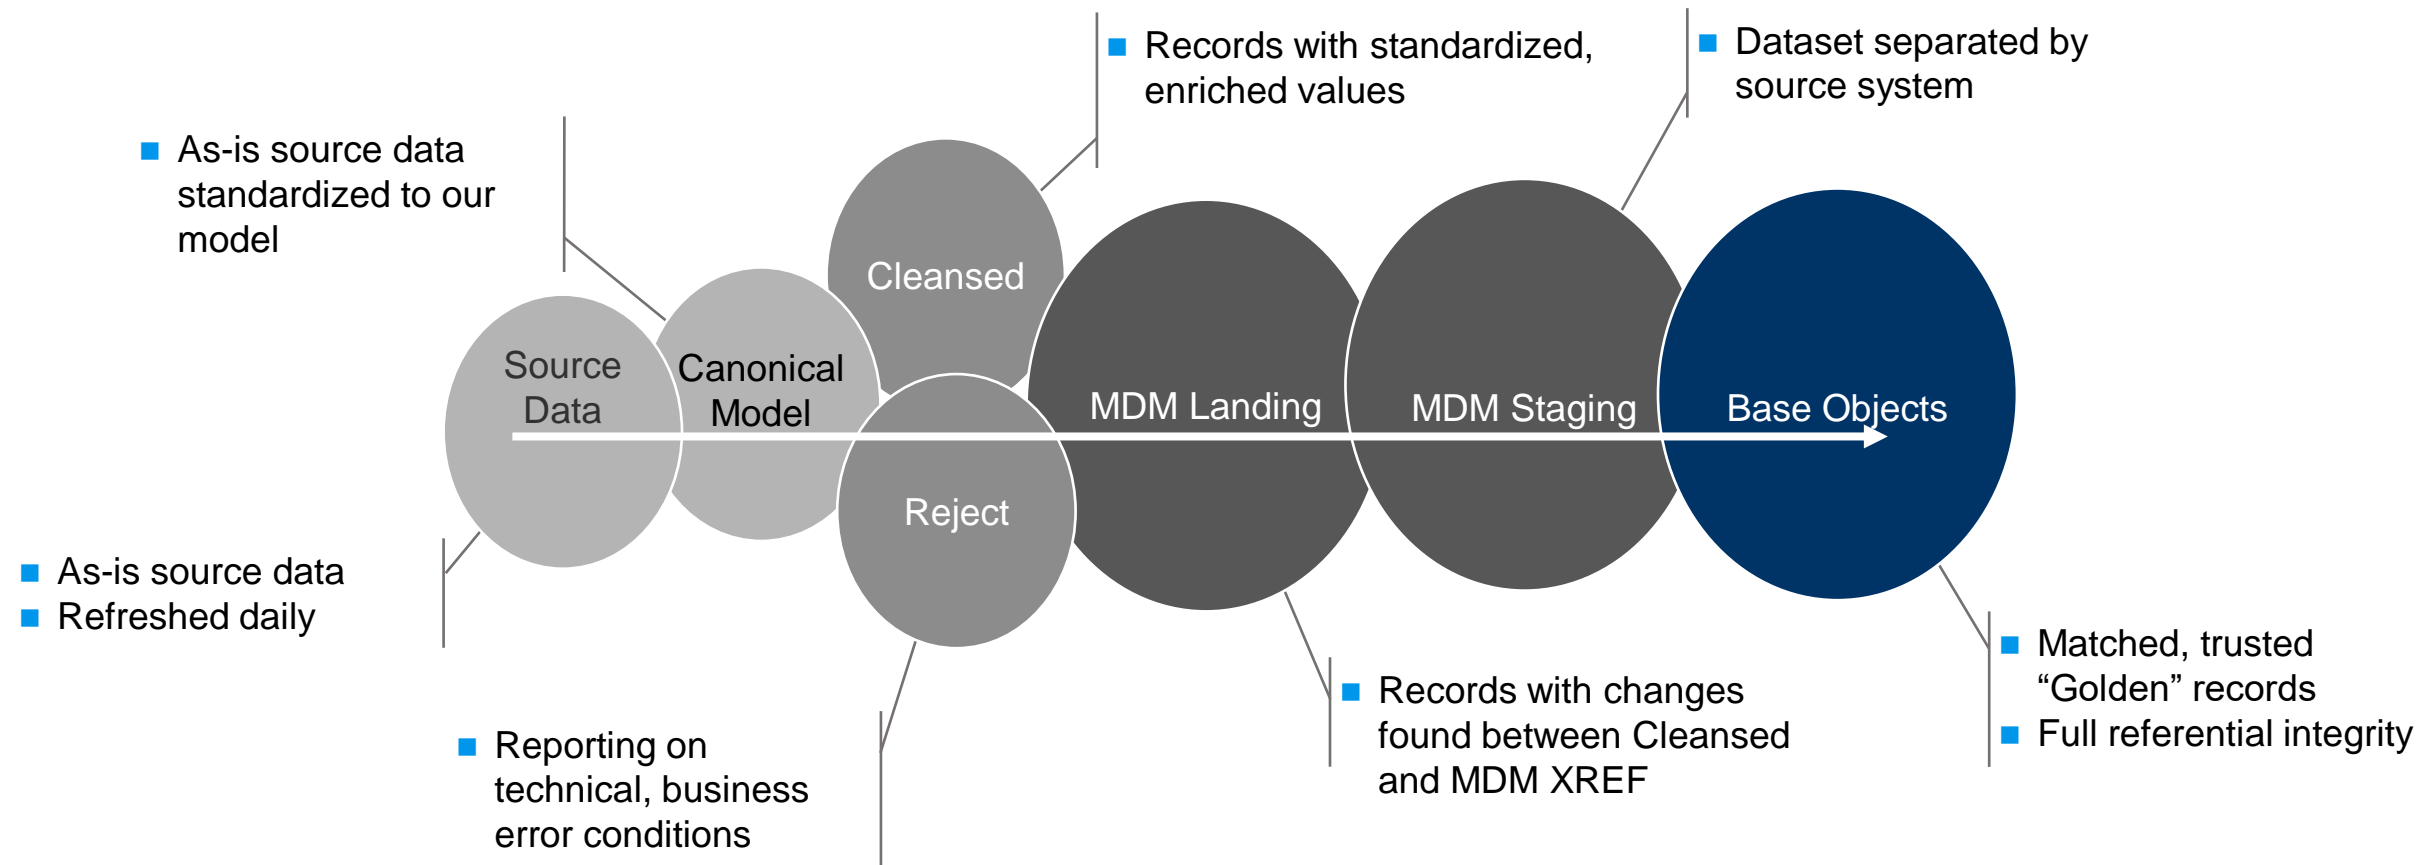

The pioneering attitude of the founders has been the foundation of our success for over 90 years. Today, **Schlumberger is the world's leading oilfield services company**, providing the most complete range of services from surface seismic to drilling, formation evaluation, well completion and stimulation services, production optimization, reservoir studies, well construction, and project management. We supply our customers with the advanced technologies and expertise required to identify, develop, and manage hydrocarbons effectively.

How Big is the Enterprise, Really?

A word cloud of enterprise metrics. The text is arranged in a roughly circular shape, with the largest text in the center and smaller text towards the edges. The colors of the text vary, including shades of blue, orange, and grey.

85 Countries
300 Source Tables
500 IDQ Mappings
100K Employees
420MM XREF Records
480MM Rows of Source Data
33 Domains 70 Source Systems
70 Data Professionals 1,300 Applications
55 Consuming Systems

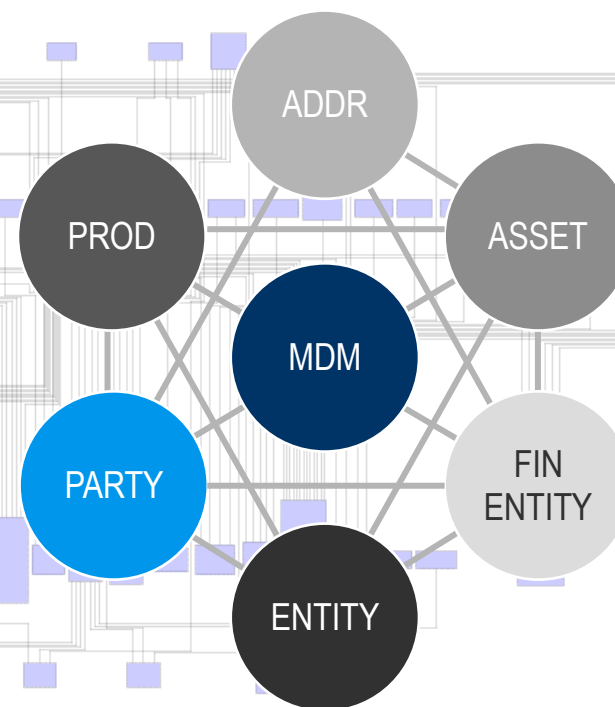

Our Traditional Batch Process

It All Starts With the Data Model

- Not exposed outside of MDM
- Highly normalized model
- Designed around generic entities:
 - Party (Person, Organization, Location)
 - Asset (Well, Field, Borehole, Rig)
 - Product (Material)
 - Entity (Organizational Structures)
 - Finance Entity (Profit / Cost Center)
- 50 nontrivial tables, 117 tables total

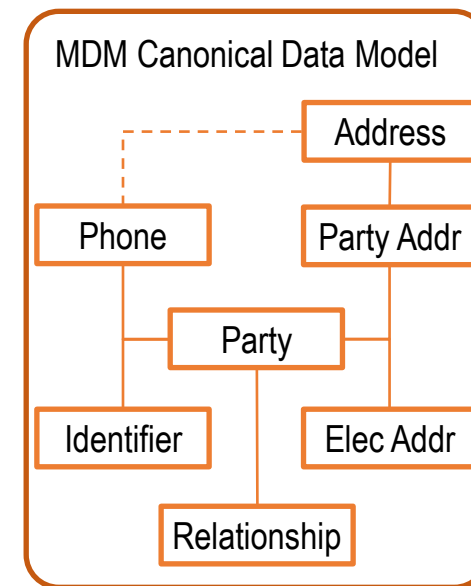

Aligning Data

- Translates source model to mapping model
- Provides filters for invalid / out-of-scope source records
- Identifies join criteria between source tables

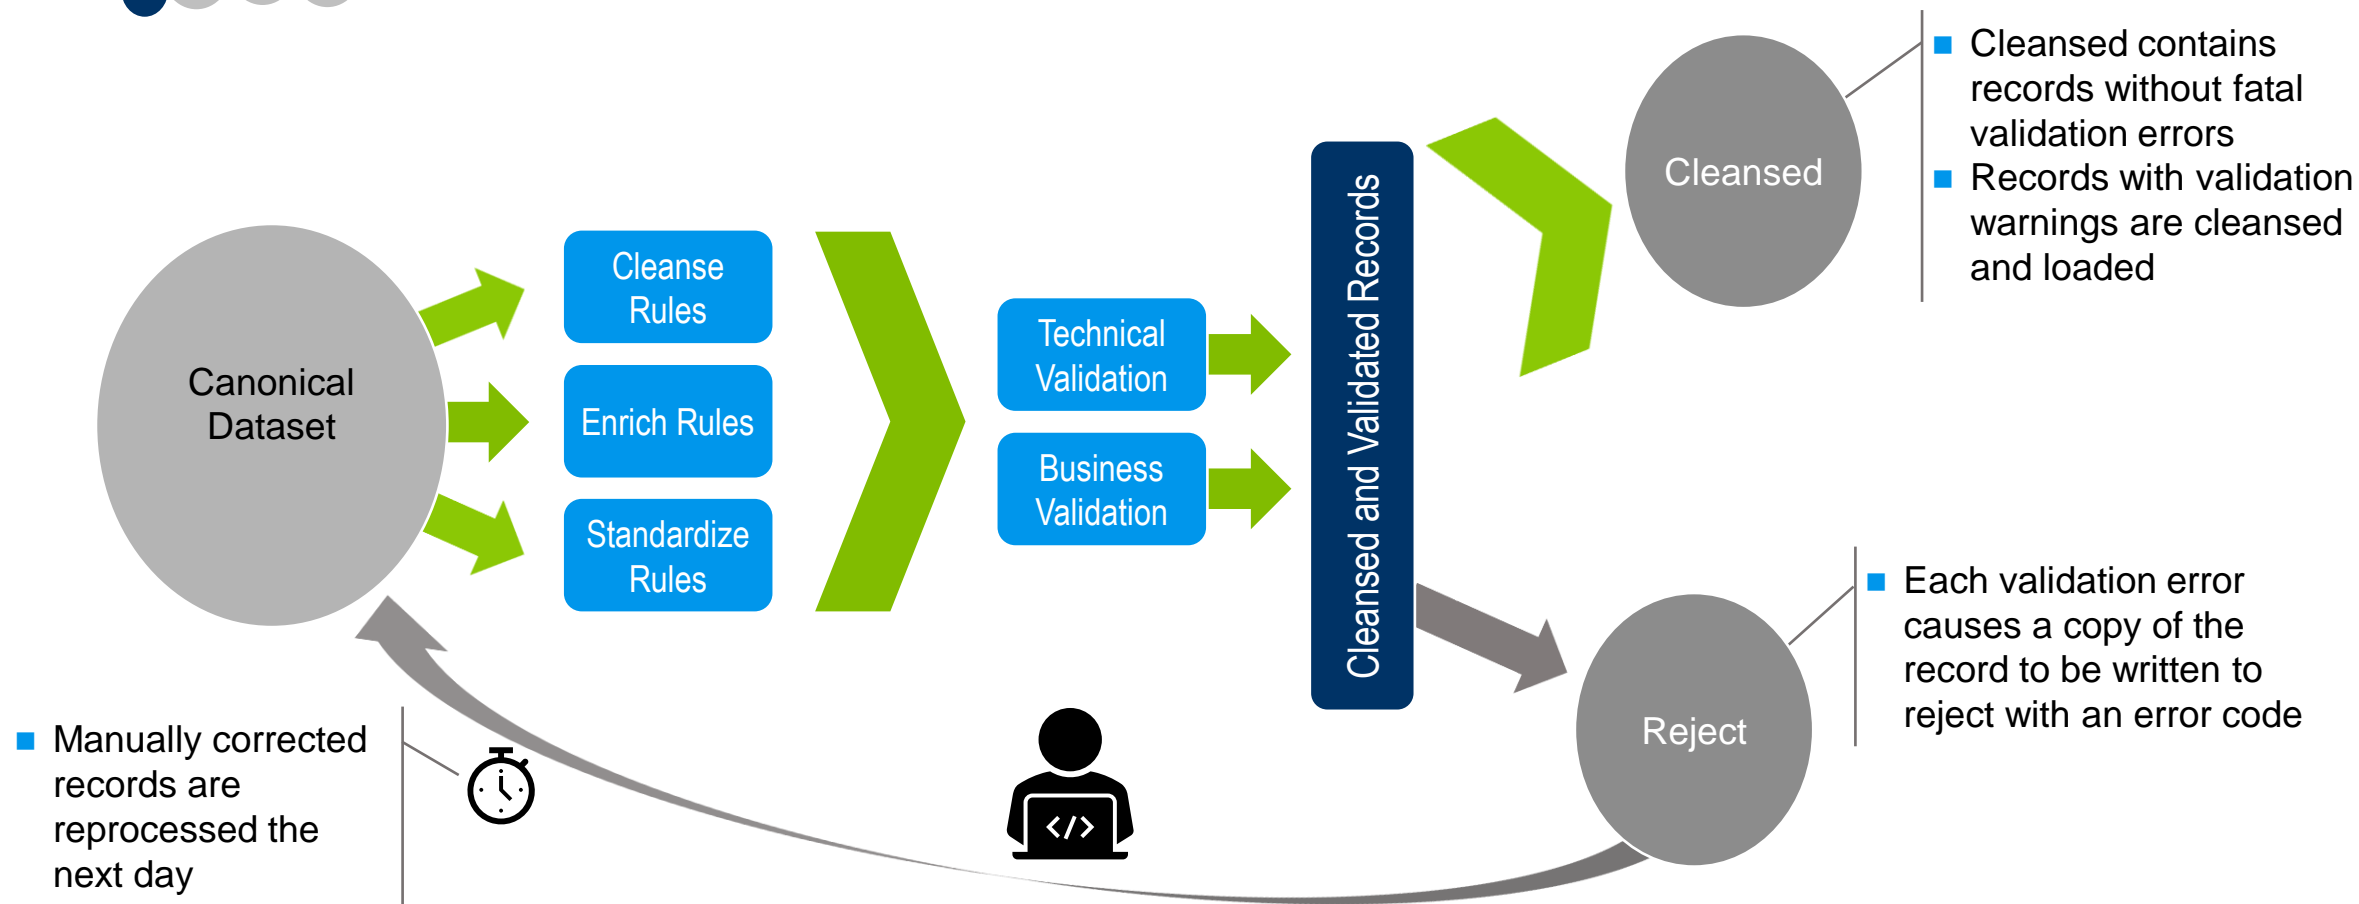

Mapping Model - Vendor

Presentation Layer

- For real-time integrations, an Elastic Search cluster is kept in sync with MDM
- Custom Web Services provide search functionality to consuming applications

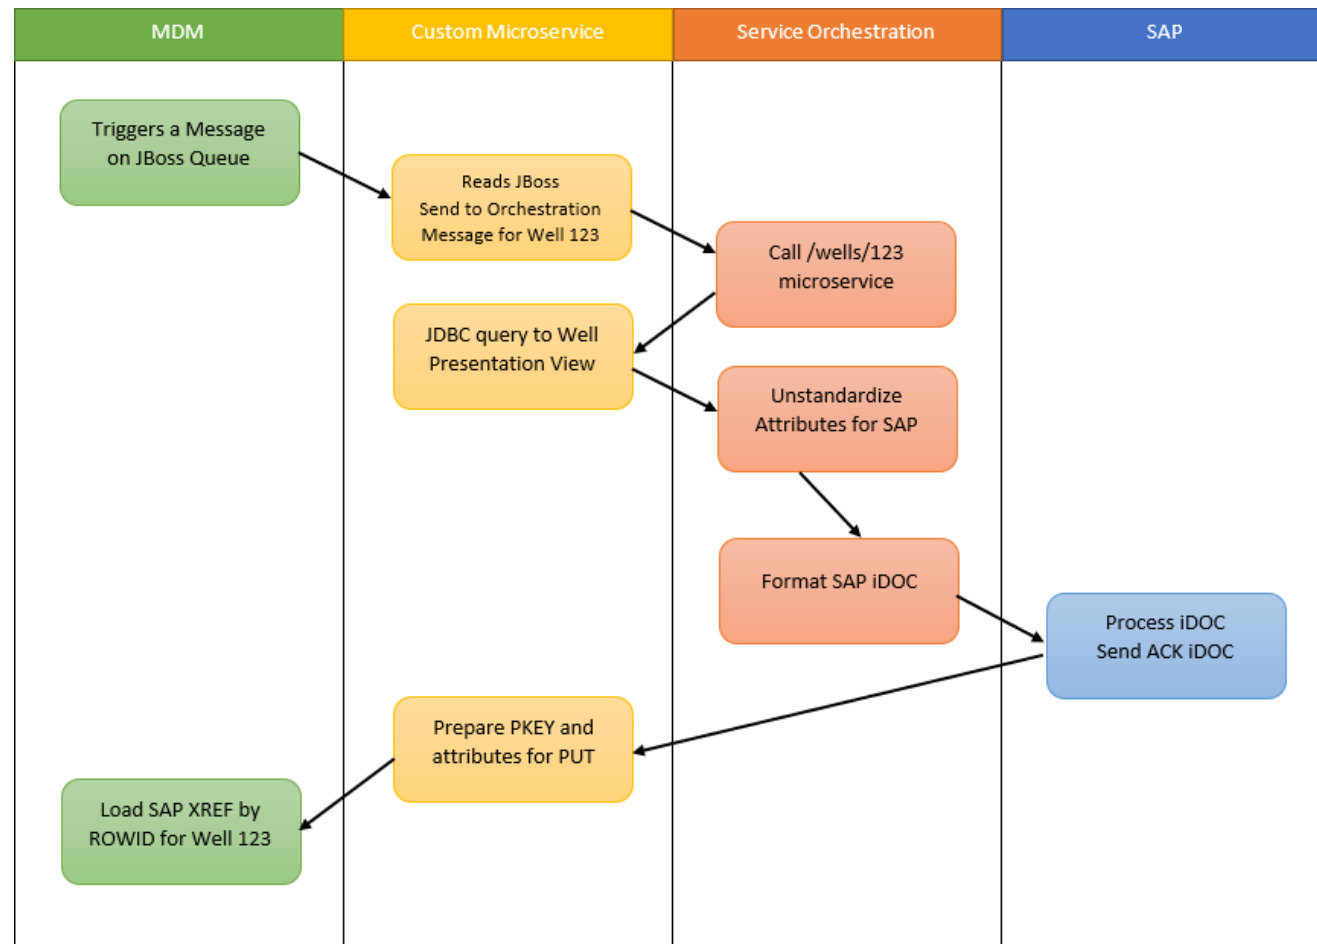

- Daily batch jobs pull changes in Master Data since the last synchronization
- Data is distributed to batch consumers via point to point integrations

Wells Master Data Becomes Real-Time

- From “Boil the Ocean” methodology to “Clean the River”
- IDD Application created for users to create or update Wells in Master Data
- Cleanse Functions leveraging all Cleansing Rules from Batch Process
- User Exit Implementation
 - Cleansing/enriching for cross-table cases
 - Checking completeness based on a parameter table
 - Checking consistency
- Real-time integration with SAP
- Hourly integration with other systems
- Result = Shut down well data entry in integrated applications

Custom-Built Real-Time Integration

- Using MDM's message triggers
- Custom Microservice code
 - Passing messages
 - Querying DB presentation views
 - Preparing the PUT message
- Storing ACK on the ASSET_XREF only
- Batch processing to SAP
- Comparison Report "CP4"

Our Vision for 2021

- **Business Entity Service**

- Presentation views in e360 instead of database
- Data represented in business-friendly format instead of MDM format in IDD
- Moving from Elastic Search manual replica to native MDM Elastic Search
- Native BES Queries to replace custom Microservice
- After Wells, MDM move to Real-Time and System of Records for 2 other domains

- **MDM Ingestion ... from Batch to Real-Time ingestion**

- Replacing batch ingestion of compatible sources with real-time ingestion using BES
- Leveraging workflow with Data Steward approvals instead of admins inputting data in IDD
